

Enterprise Process Integration

22.10.2007

Janne J. Korhonen

22.10.2007

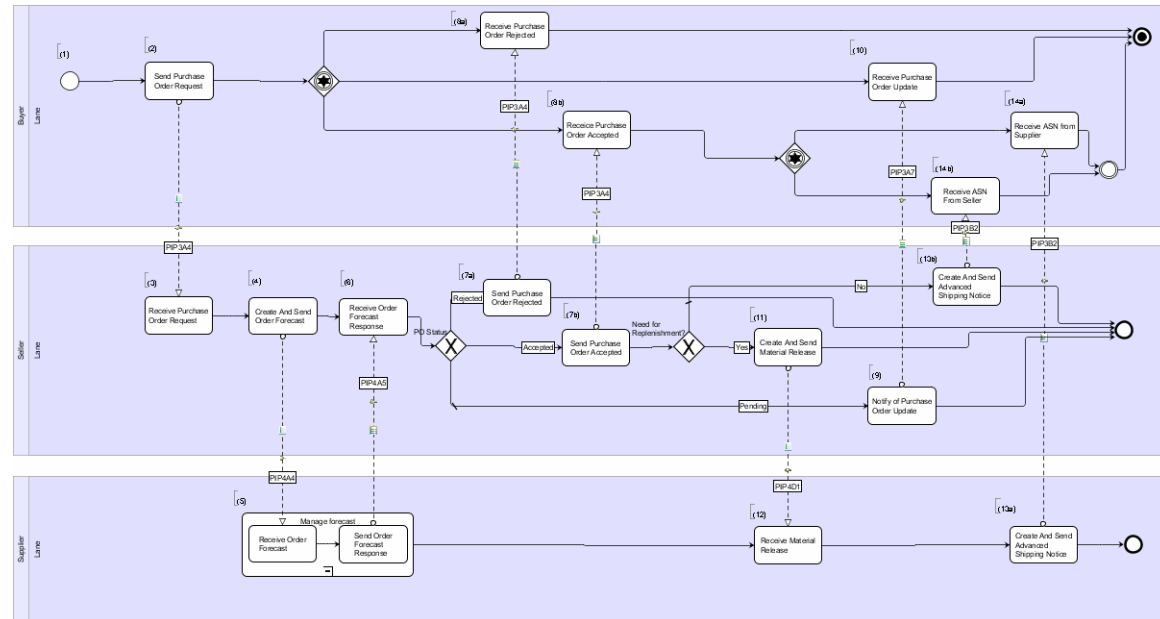

What is a process?

A process is a coherent set of activities carried out by a collaborating set of roles to achieve a goal.

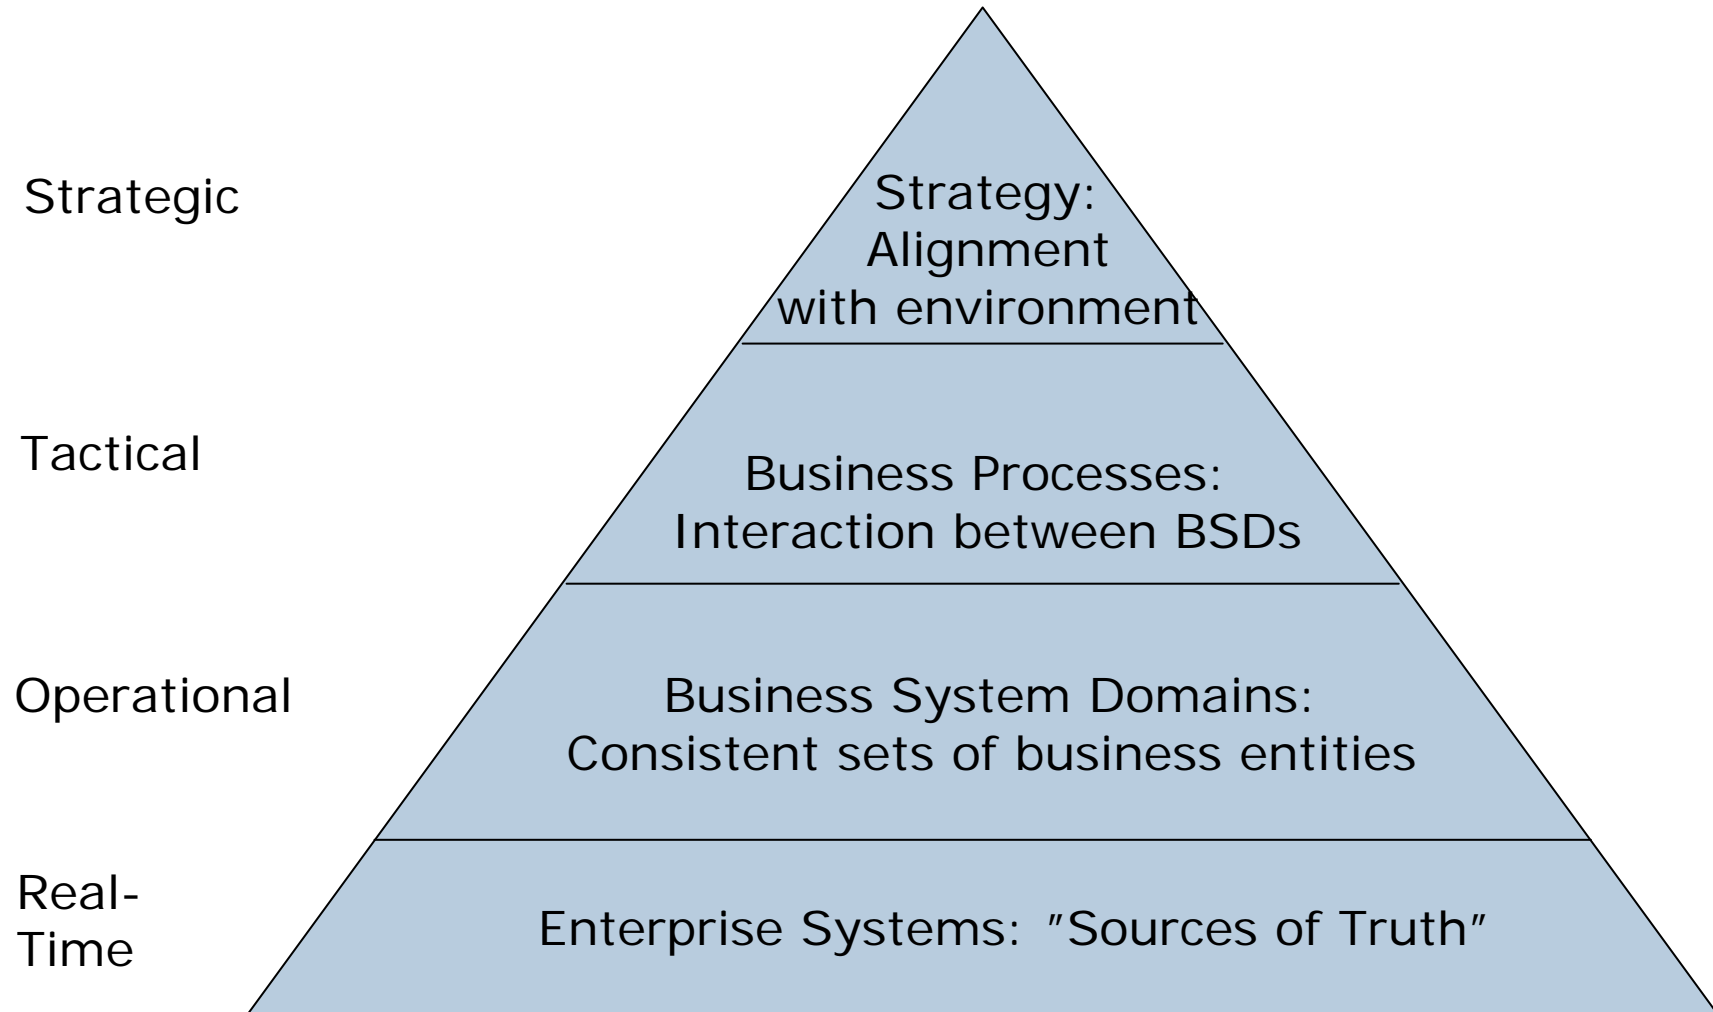

– Ould: Business Process Management: A Rigorous Approach

A business process is the complete and dynamically coordinated set of collaborative and transactional activities that deliver value to customers.

– Smith and Finger: Business Process Management: The Third Wave

Anatomy of Enterprise

Integration at Real-Time Level: Coherence

Enterprise Application Integration (EAI)

- Brokering
- Federation

Enterprise Information Integration (EII)

- Virtualization of heterogeneous data
- Uniform data access
- Uniform information representation

Extract, Transformation, Load (ETL)

- Extracting data from outside sources,
- Transforming it to fit business needs
- Loading it into the end target

Integration at Operational Level: Control

Workflow

- “The automation of a business process, in whole or part, during which documents, information or tasks are passed from one participant to another for action, according to a set of procedural rules.” (Workflow Management Coalition)

Orchestration

- An imperative formal description of the sequence and conditions in which an executable process invokes services and interacts with other processes in order to achieve its design objectives.

Integration at Tactical Level: Coordination

Business Process Management (BPM)

- Loose-coupling
- Document-style interaction
- Reliable asynchronous messaging
- Compensation
- Executable processes
- Complex outcomes
- Negotiated commitments
- Distributed state

Integration at Strategic Level: Consolidation

Data mining, analysis and reporting:

Enterprise Metadata Repository (EMR)

- Enterprise Architecture view

Business Intelligence (BI)

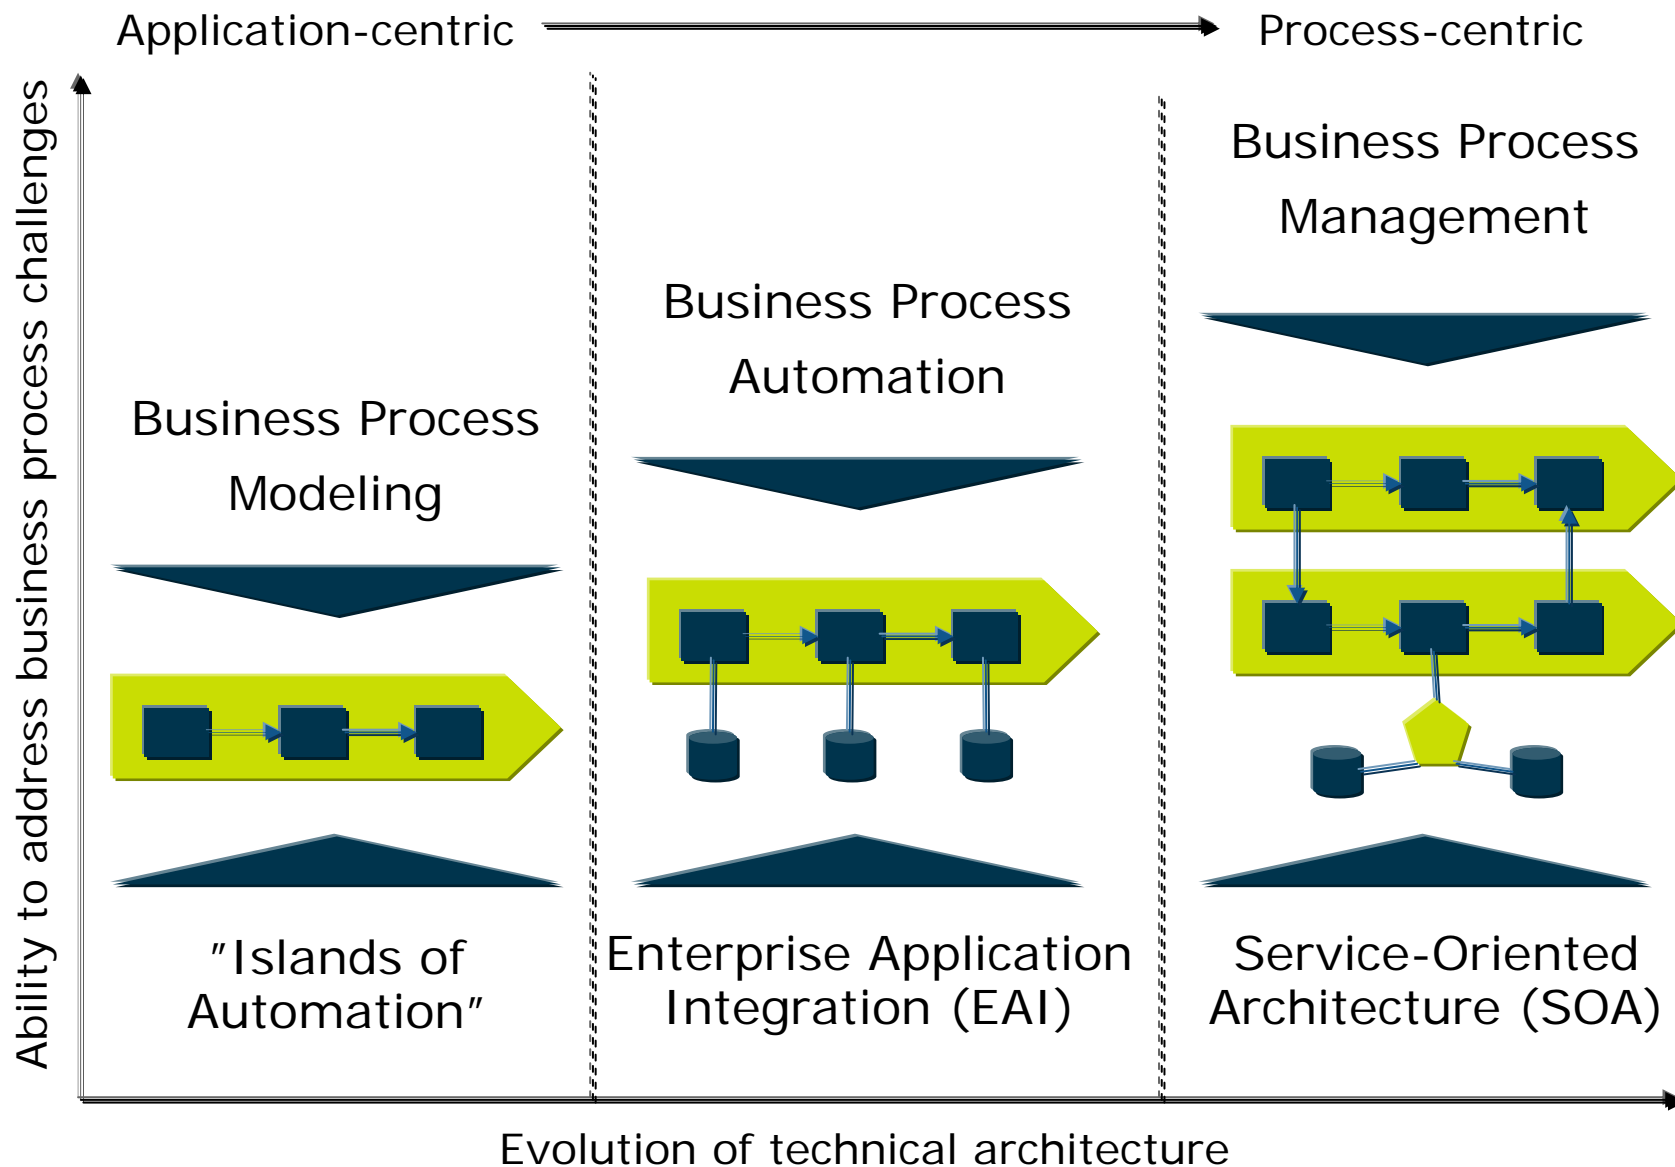

- Information about company operations

Business Activity Monitoring (BAM)

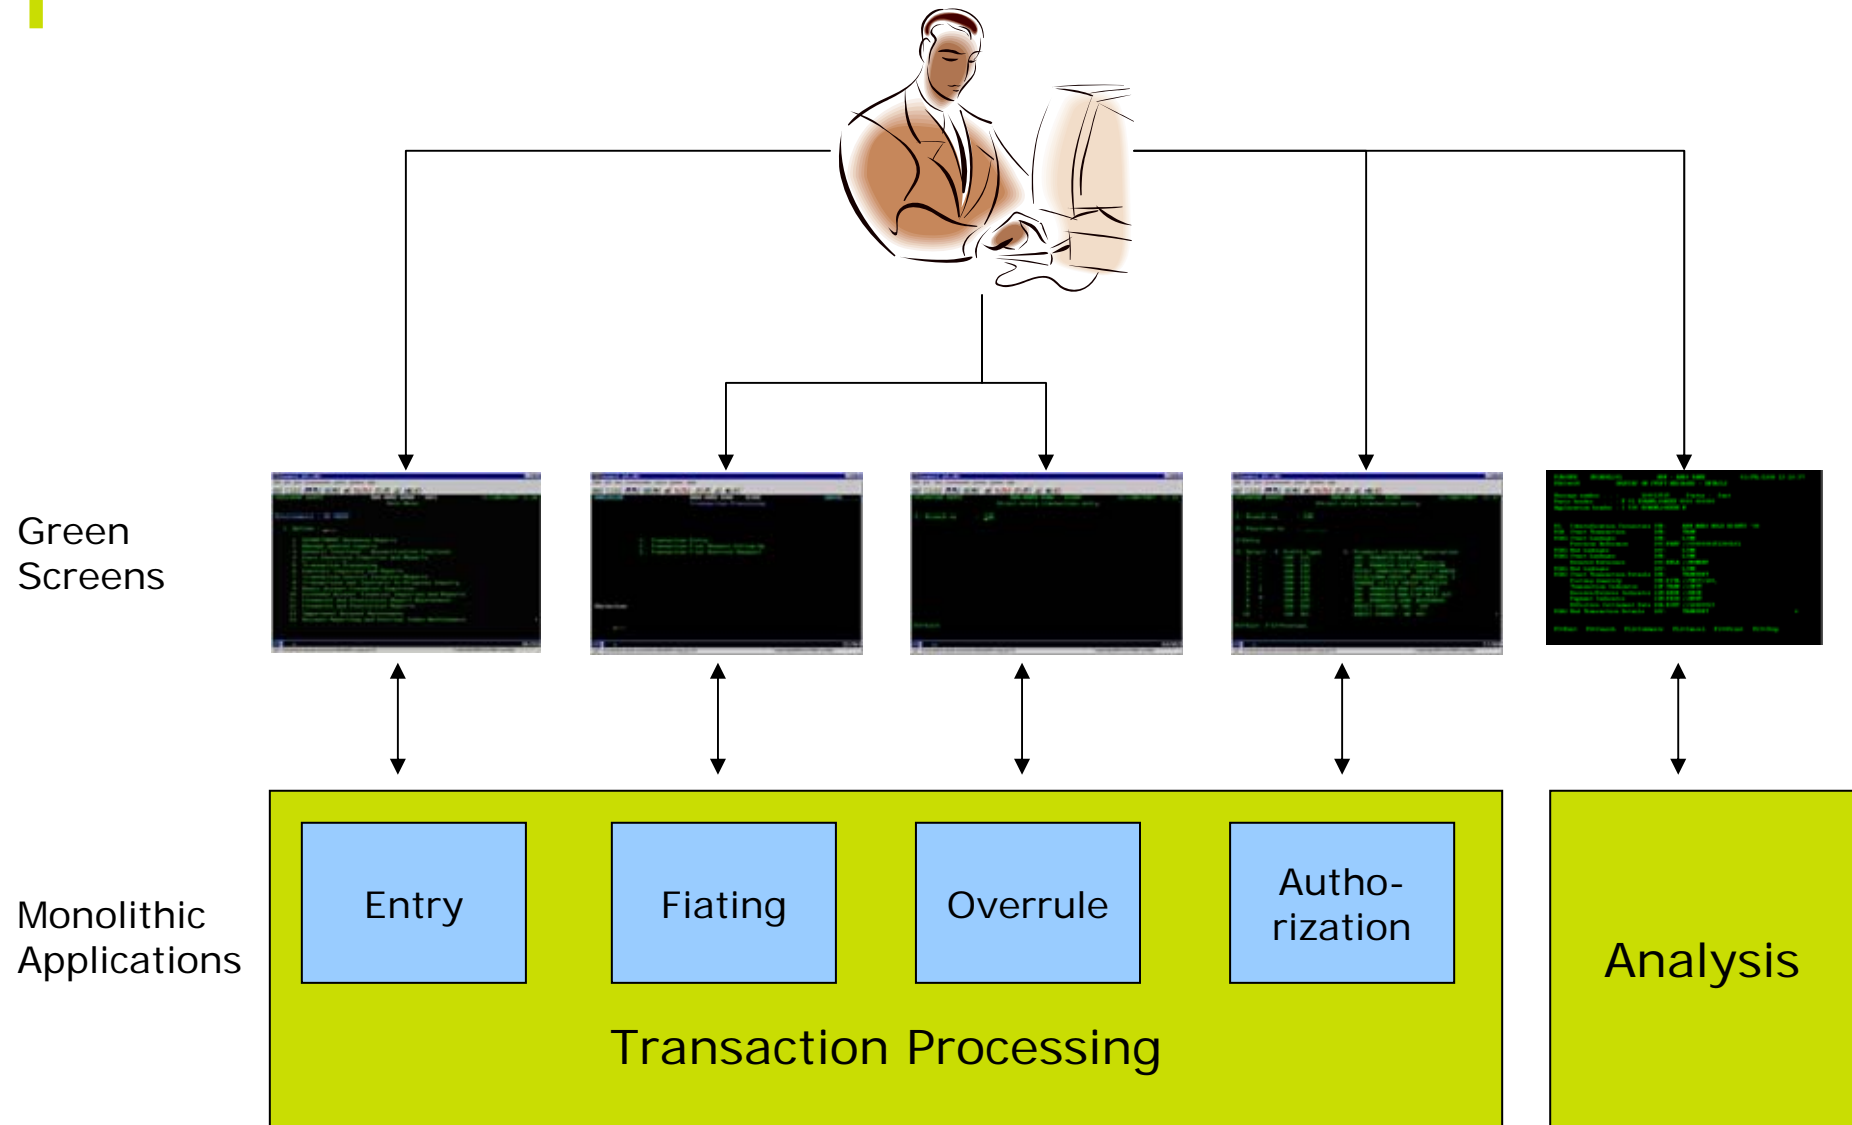

- Real-time summary of business activities

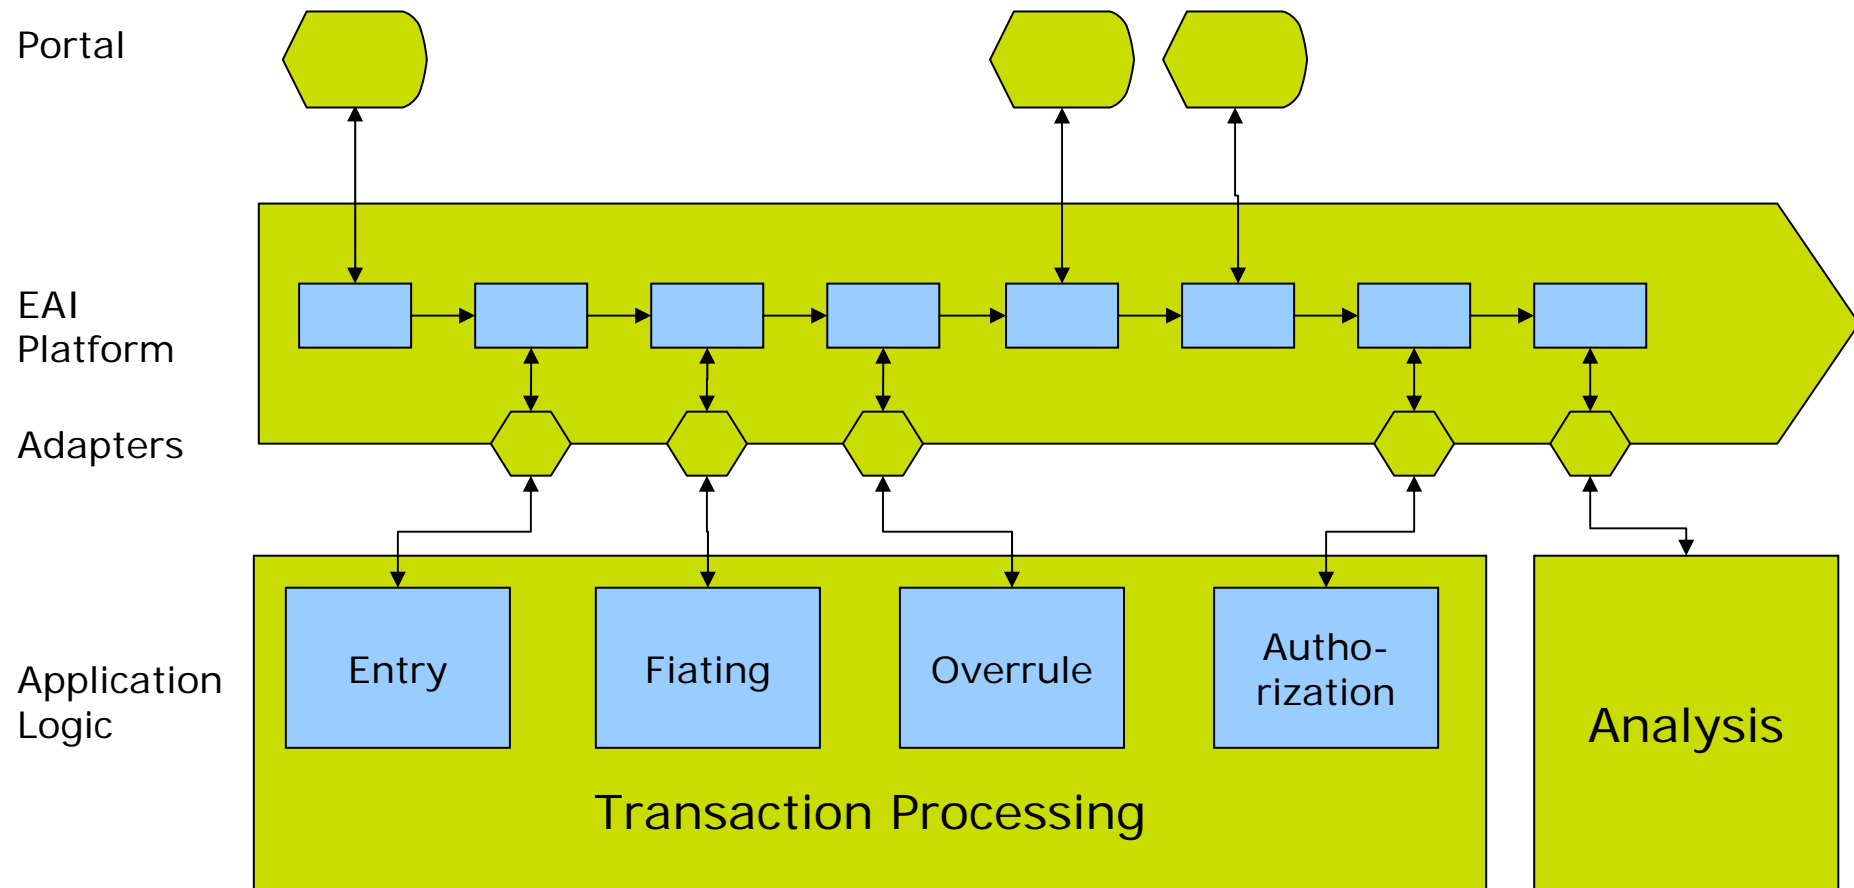

Levels of Process Digitization

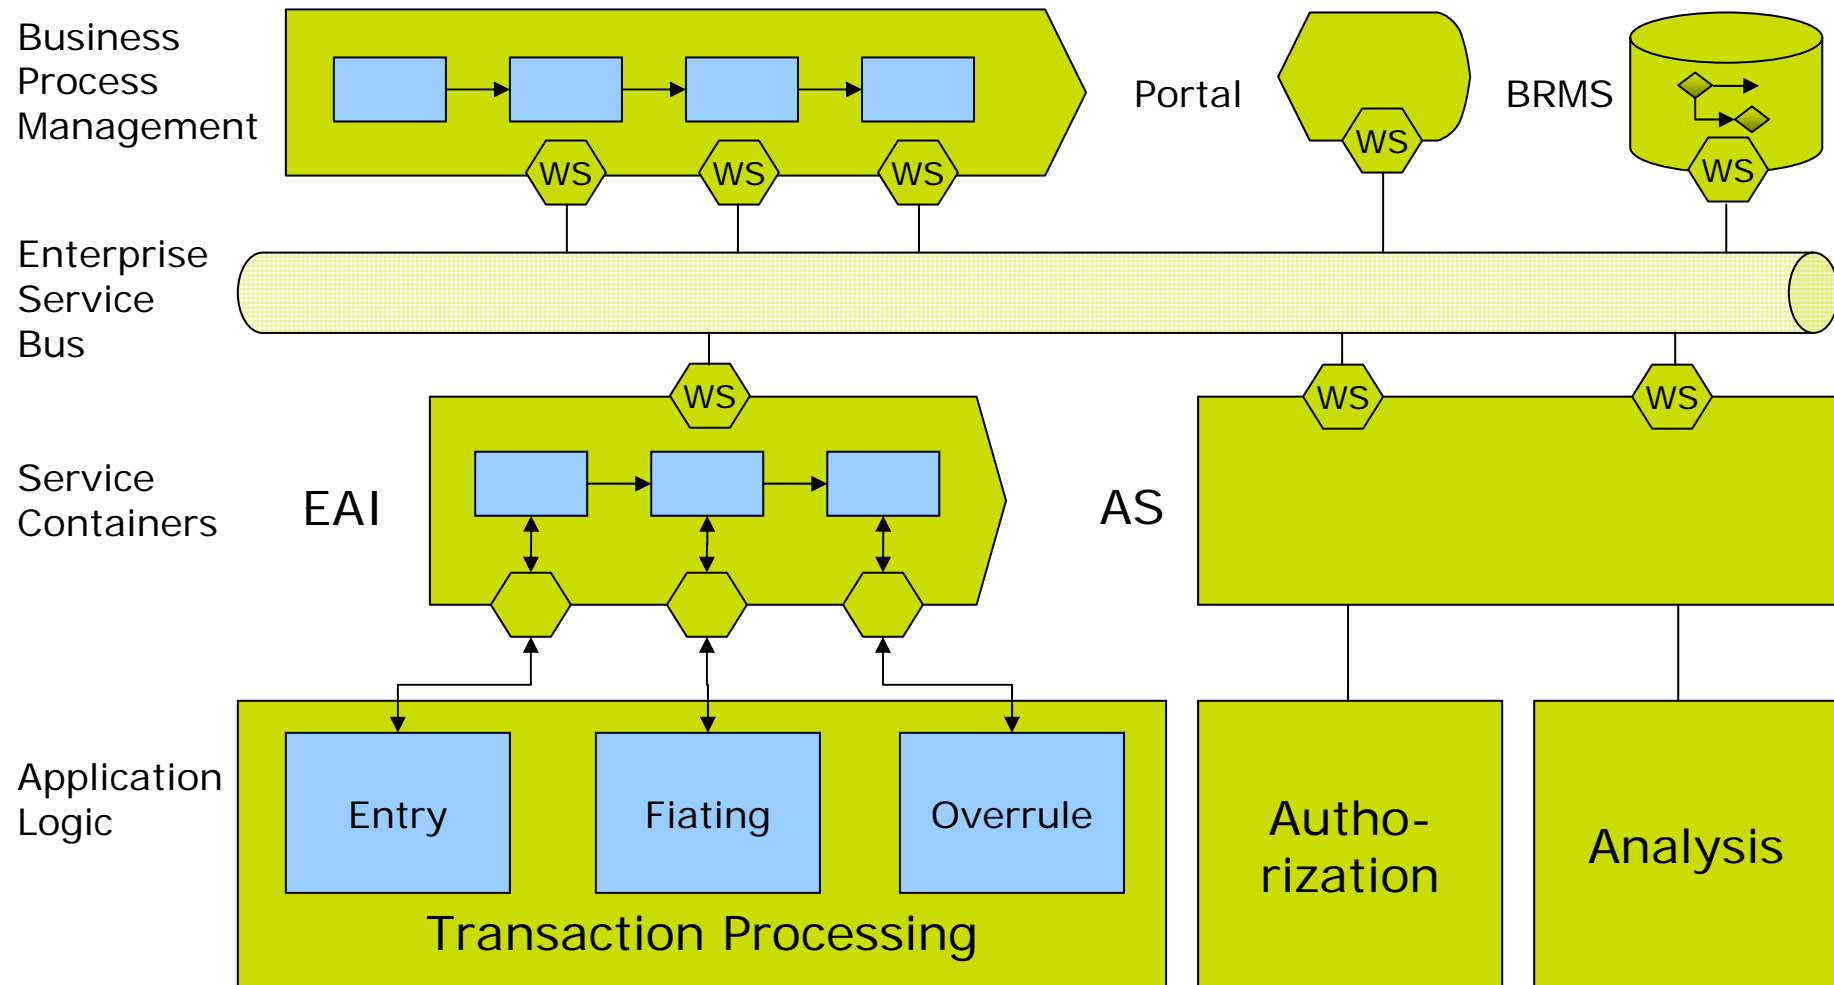

First Level: "Workflow in the Brain"

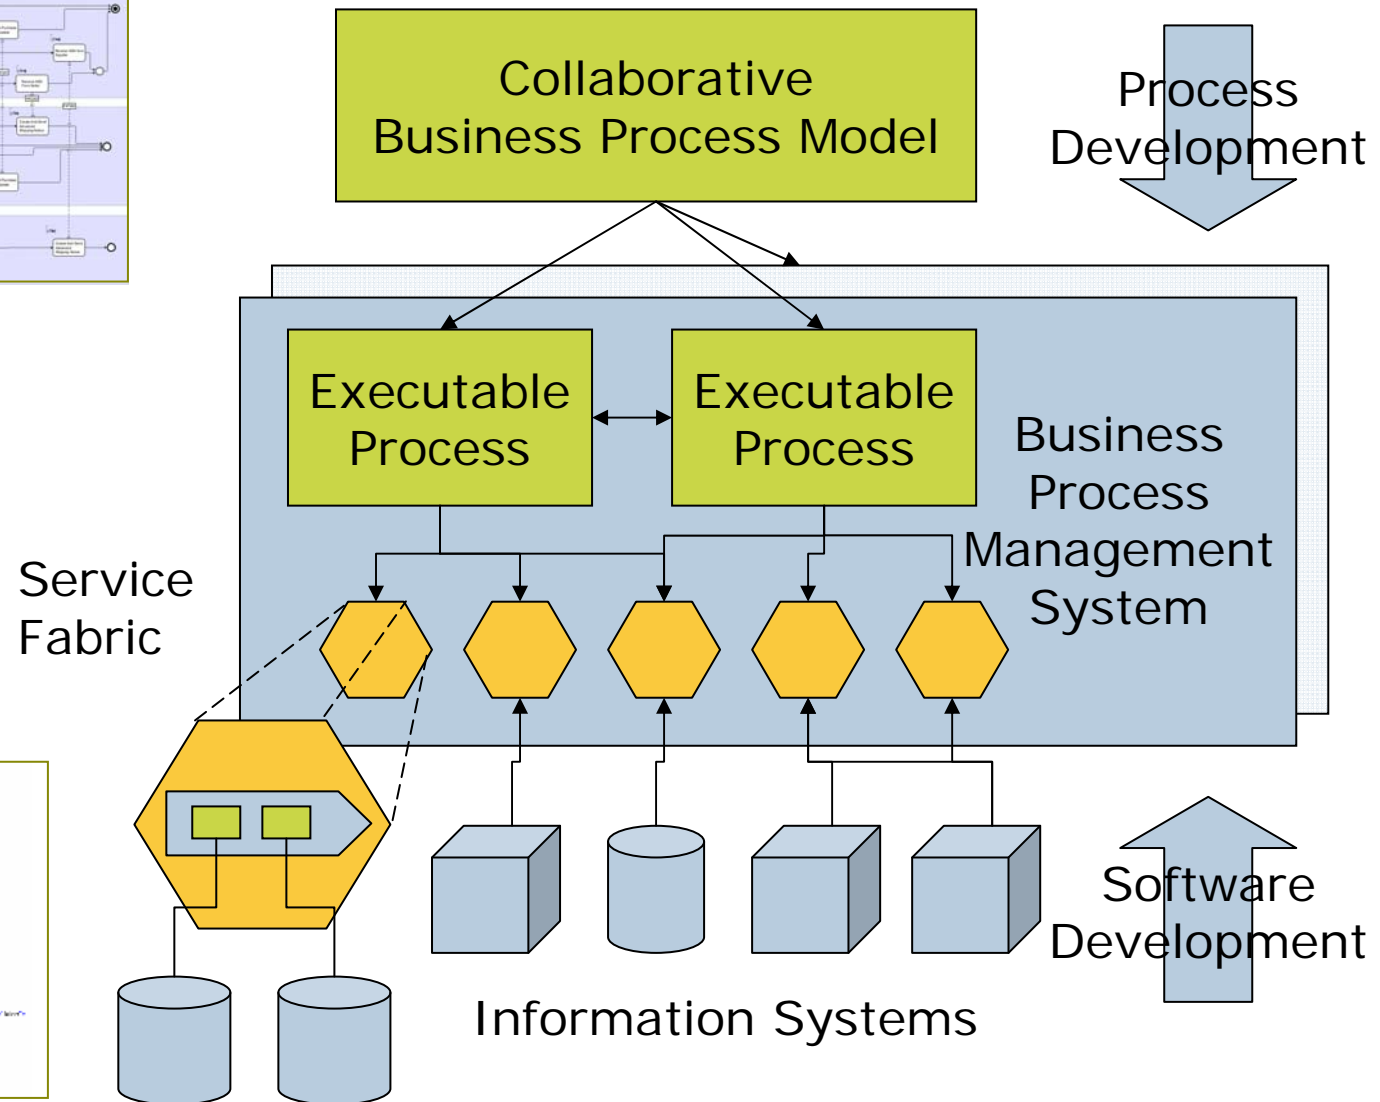

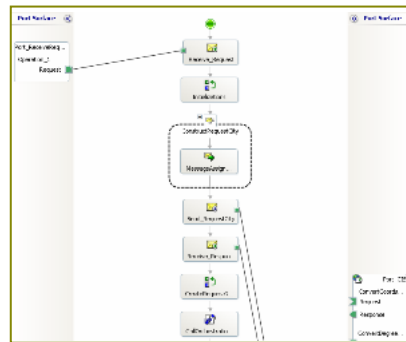

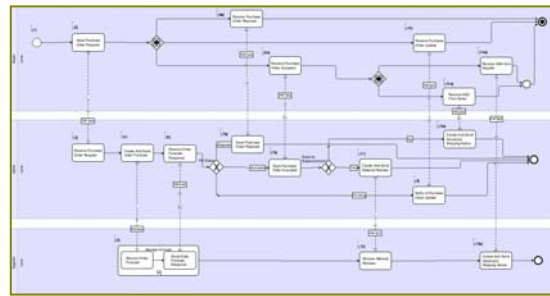

Second Level: Business Process Automation

Third Level: Business Process Management

Top-Down Meets Bottom-Up in BPMS

Business Process as a Network: Private and Public Processes

Private Process

- Specifies the process control logic within the context of a business process participant

Public Process

- Governs externally observable behavior of business process participants by specifying the message exchange between them

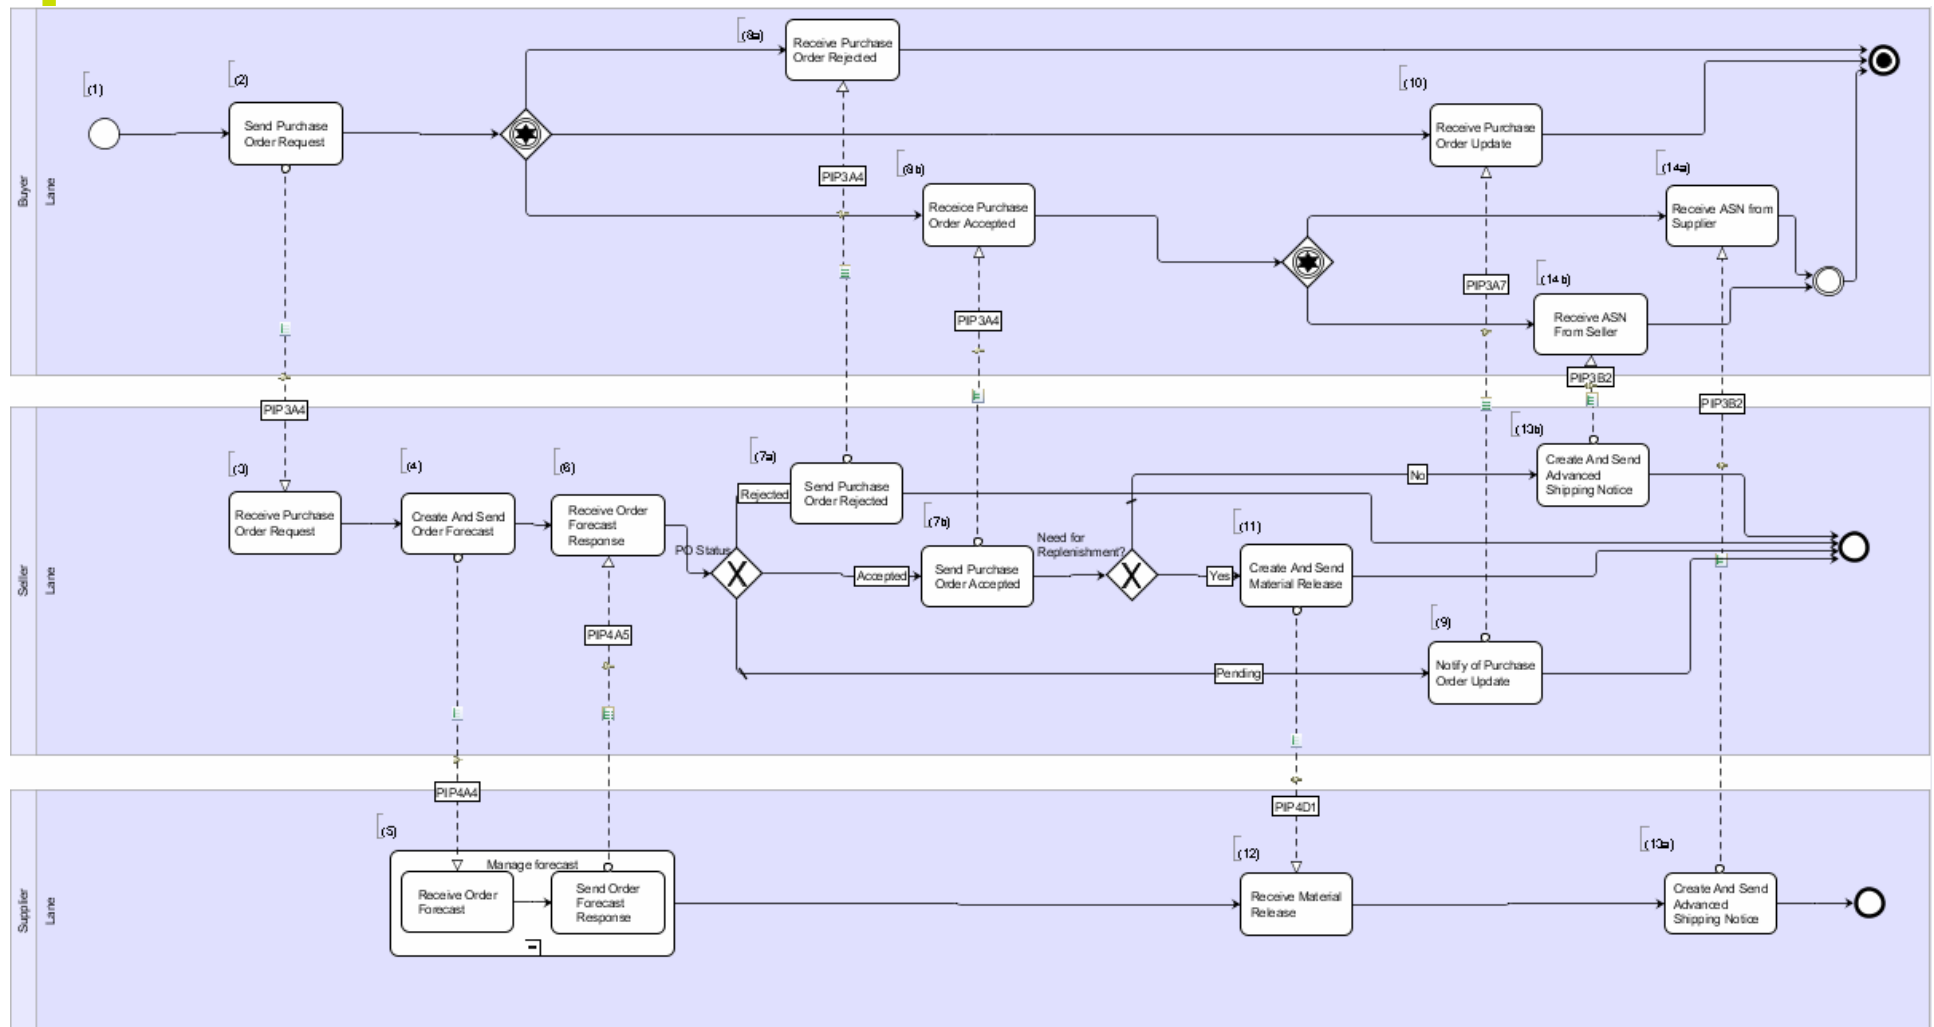

Orchestration and Choreography specify private and public process, respectively

Orchestration is an imperative formal description of the sequence and conditions in which an executable process invokes services and interacts with other processes in order to achieve its design objectives.

Choreography is a declarative formal description of the coordination between multiple participants, specifying their roles and observable message exchange.

Collaborative Process Example

Agility Through Business Process Management

Visibility

- Business processes are explicitly designed in a standards-based process description language
- Process information can be readily retrieved and tracked in real time.

Speed

- Process models are executable
- Business processes can be changed quickly by modifying the process model

Flexibility

- Business processes consist of more elementary processes and services
- New processes can be developed by combining these context-independent services in novel ways

High Quality

- Business processes can be tracked in real time
- The quality of service can be verified at any instant of time

Efficiency

- Utilization of resources can be tracked at different phases of the process
